4-Channel Input Audio Processor

PT2314

DESCRIPTION

PT2314 is a four-channel input digital audio processor utilizing CMOS Technology. Volume, Bass, Treble and Balance are incorporated into a single chip. Loudness Function and Selectable Input Gain are also provided to build a highly effective electronic audio processor having the highest performance and reliability with the least external components. All functions are programmable using the I²C Bus. The pin assignments and application circuit are optimized for easy PCB layout and cost saving advantage for audio application.

FEATURES

- CMOS Technology
- Least External Components
- Treble and Bass Control
- Loudness Function
- 4 Stereo Inputs with Selectable Input Gain
- Input/Output for External Noise Reduction System/Equalizer
- 2 Independent Speaker Controls for Balance Control
- Independent Mute Function
- Volume Control in 1.25 dB/step
- Low Distortion
- Low Noise and DC Stepping
- Controlled by I²C Bus Micro-Processor Interface
- Available in 28 Pins, DIP or SOP

APPLICATIONS

- Car Stereo (Audio)
- Hi-Fi Audio System

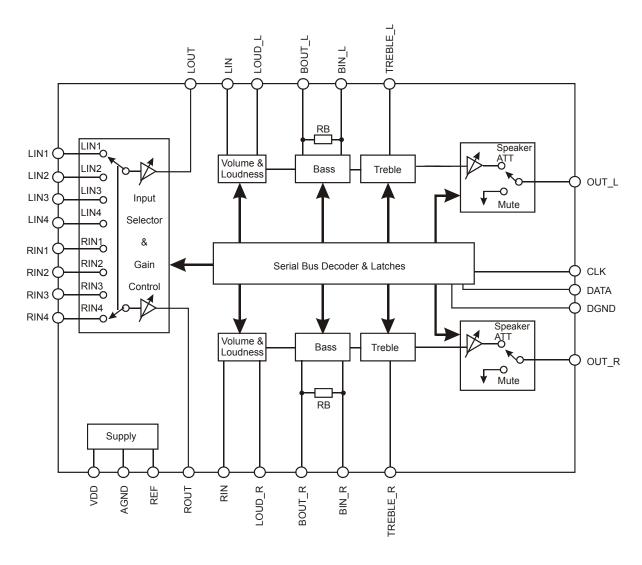

Note: Purchase of I²C Component of Princeton Technology Corporation (PTC) conveys a license under Philips I²C Patent Right to use these components in any I²C System, provided that the system conforms to the I²C Standard Specification defined by Philips

FUNCTIONAL DESCRIPTION

BUS INTERFACE

Data are transmitted to and from the microprocessor to the PT2314 via the DATA and CLK. The DATA and CLK make up the BUS Interface. It should be noted that the pull-up resistors must be connected to the positive supply voltage.

DATA VALIDITY

A data on the DATA Line is considered valid and stable only when the CLK Signal is in HIGH State. The HIGH and LOW State of the DATA Line can only change when the CLK signal is LOW. Please refer to the figure below.

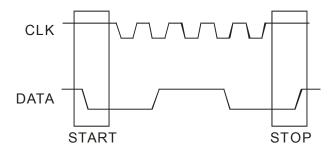

START AND STOP CONDITIONS

A Start Condition is activated when

- 1) the CLK is set to HIGH and
- 2) DATA shifts from HIGH to LOW State.

The Stop Condition is activated when

- 1) CLK is set to HIGH and
- 2) DATA shifts from LOW to HIGH State. Please refer to the timing diagram below.

BYTE FORMAT

Every byte transmitted to the DATA Line consist of 8 bits. Each byte must be followed by an Acknowledge Bit. The MSB is transmitted first.

4-Channel Input Audio Processor

PT2314

ACKNOWLEDGE

During the Acknowledge Clock Pulse, the master (μP) puts a resistive HIGH level on the DATA Line. The peripheral (audio processor) that acknowledges has to pull-down (LOW) the DATA line during the Acknowledge Clock Pulse so that the DATA Line is in a Stable Low State during this Clock Pulse. Please refer to the diagram below.

The audio processor that has been addressed has to generate an acknowledge after receiving each byte, otherwise, the DATA Line will remain at the High Level during the ninth (9th) Clock Pulse. In this case, the master transmitter can generate the STOP Information in order to abort the transfer.

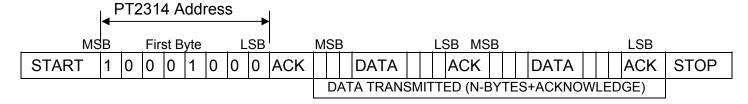

TRANSMISSION WITHOUT ACKNOWLEDGE

If you want to avoid the acknowledge detection of the audio processor, a simpler μP transmission may be used. Wait one clock and do not check the slave acknowledge of this same clock then send the new data. If you use this approach, there are greater chances of faulty operation as well as decrease in noise immunity.

INTERFACE PROTOCOL

The interface protocol consists of the following (see diagram below):

- A Start Condition
- A Chip Address Byte including the PT2314 address. The 8th Bit of the Byte must be "0". PT2314 must always acknowledge the end of each transmitted byte.
- A Data Sequence (N-Bytes + Acknowledge)
- A Stop Condition

Note:

ACK = ACKNOWLEDGE

MAX. CLOCK SPEED = 100KBITS/S

Notes:

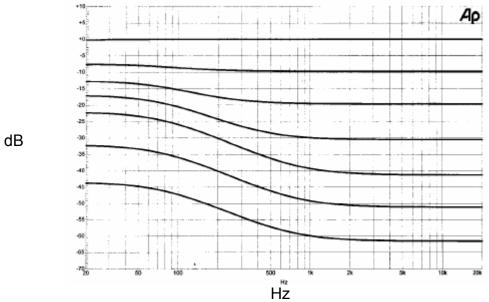

- 1. For the Bass and Treble Response, please, refer to the diagram below. The center frequency and quality of the resonance behavior can be selected by the external circuitry. A standard first order bass response can realized by a standard feedback network.
- 2. The selected input is grounded thru the 2.2µF capacitor.
